

**Features:**

- Fixed voltage input, isolated non regulated dual output
- Working temperature range -40 °C to +105 °C
- Small SMD package, international standard pin method
- Isolation voltage 1500Vdc
- Typical efficiency up to 86%
- 3 year warranty

## Product parameters

Line regulation	---	1.5% max.
Load regulation	10%~ 100% full load	15%max.
Isolation voltage	Leakage current < 1mA/1min.	1500Vdc min.
Isolation resistance	Test at 500vDc	1000mΩ min.
Switching frequency	---	250KHz typ.
Ripple and noise	Band width 20MHz	100mVp-p max.
Temperature coefficient	Rated load	+0.03%/'C max.
Operating temperature range	---	-40°C to +85°C
Storage temperature range	---	-55°C to +125°C
Short circuit protection	---	1S
MTBF	---	3500Khrs
Weight	---	1.2g

1. Other input and output models may available on request;
2. Above models are default to metal case.
3. Both positive and negative outputs have the same capacitive load.
4. Ripple noise is generated by connecting a 12 # twisted pair cable, setting the oscilloscope bandwidth to 20MHz, using a 100M bandwidth probe, and parallel connecting a 0.1uF polypropylene capacitor and a 4.7uF high-frequency low resistance electrolytic capacitor at the probe end. The oscilloscope uses Sample sampling mode for sampling.

## Temperature reduction curve

## LC filtering circuit

Try to avoid no-load use: When the load power consumption is less than 10% of the output rated power of the module, it is recommended to connect a dummy load outside the output end or select a module with smaller rated power, the dummy load (resistance) can be calculated according to 10% of the rated power of the module, the resistance value  $R=U^2 / (10\% \times 1W)$ ; The output external capacitor should not be too large: the capacity of the output external capacitor C2 should not be too large, otherwise it is easy to cause overcurrent or poor start when the module is started, which should be selected according to the capacitor external table; The input of this series does not support parallel use of hot swap and output  
For occasions with high ripple noise requirements, an external LC filter circuit should be connected, and the resonant frequency of the LC filter is much smaller than the switching frequency of the DC/DC module to prevent mutual interference, resulting in increased output ripple or module damage, as shown in the figure above:
